Pulsation Lite For PC

We finally made it. Pulsation Lite is finally ready to be released. Although it's only for Mac OS X 10.4 Tiger (Apple Computer, Inc. October 23, 2003) and so the menu system is built for the Mac OS and is a bit different from what is out there but hey, we're actually releasing something. Features Very simple interface with a main window, voice menu (choose your sound source and form your sound), and a small preview area. Form your sound at any point by selecting from five pulse widths: Short (1.5-2ms), Medium (2.5-3.0ms), Long (3.5-4.0ms), Long (5-6ms) and Long (10-12ms). Pulse sequencing is done with the waveform display mode (MPE-2000) Use the audio input port to connect an external microphone so the system can be controlled with voice commands (we will add this in version 1.5) We plan on adding the ability to add effects and modulations so there is a lot of functionality still to come but for now you can easily access the most common synth effect: volume which just changes the sound output level. Audio input port to connect an external microphone so the system can be controlled with voice commands (we will add this in version 1.5) New in this version is a calibration feature. Pulsation Lite will always speak to you with the same intensity if you are not inputting (e.g. connect an external microphone) so this can be used to calibrate the output. Pulse Widths The pulse wave sounds are produced by the alternating positive and negative signals that are created by the sampling rate of the audio data and the options to adjust the pulse widths and latching. There are five different pulse width settings: Short Pulse (1.5-2ms) Medium Pulse (2.5-3ms) Long Pulse (3.5-4ms) Long Pulse (5-6ms) Long Pulse (10-12ms) The choices can be chosen by clicking on the small button immediately to the left of the window or by pressing the desired key on the Macintosh keyboard. The pulse wave sounds can be created by a short or a long pulse width. In general, a short pulse

What's New in the?

You can use the oscillator window to create waveforms, which include mono pulses to tri-pulses which are nice and simple to use but you can use the envelope controls or the LFO to further create audio waves to add extra features and create a diverse amount of sounds, you can use the envelope controls to switch between positive and negative envelopes or to boost or cut the mid off, you can control the rate of the waveform using the LFO to give it depth or use the rate in conjunction with the LFO to control the pitch of the waveform. You can use the amplitude control to control the size of the waveform. You can control the frequency of the waveform using the oscillator tuning slider, the pulse width, the LFO or the pitch of the Oscillator. You can also control the time of the waveform using the rate of the LFO or the tuning of the oscillator. You can use the Pitch Bend to control the pitch of the waveform, although it is not a very well implemented pitch bend control but I have made the most of what it does. You can also switch between square and sawtooth waveforms and there is a switch between using noise, on or off. You can use the envelope to control the amount of amplification applied to the waveform, there is also a switch which allows you to adjust the amount of compression on the waveform using the Sawtooth envelope. You can also control the Pulse Width, the LFO, or the rate of the LFO to control the rate of the waveform in relation to the pitch of the Oscillator. You can use the Envelope to control the amplitude of the waveform which is great for the more advanced user. Modulation: We have added the capability to modulate the pulse width and the rate of the LFO in addition to the pitch bend. You can also modulate the pitch and volume using the LFO. Note: This is a free version of Pulsation Lite, it will only output mono from the oscillator, so if you want stereo you will need to buy the full version. Installation: Pulsation Lite is available from this web page on the Audio Edition Software page. Pulsation Lite Features: * Simple to use Pulse Wave Synthesis * Pulsation Lite free to use * Adjustable Pulse Width * Control Rate of the LFO and Pulse Width * Control the Pitch Bend
